Miter Frame Profiles

Fleetwoods is pleased to provide its customers with the design option of a high quality construction mitered door. These doors employ a uniquely engineered joint using both dowels and micro finger-joints.

1. All mitered doors are currently subject to CUSTOM scheduling. Please call when ordering for a schedule estimate.
2. All mitered doors are style #290- with the appropriate configuration suffix.
3. Mitered frames can be combined with almost any panel profile to create a wide range of appearances.
4. Like dovetail drawers, a small portion of the joint is visible on the edge of the door (about 3/16").
5. Mitered doors are provided with finished outside edged and finish sanded fronts unless otherwise specified when ordering.
6. Natural wood products will expand and contract in response to the changes in environmental moisture conditions. Fleetwoods mitered door joints are specifically engineered to accommodate this natural characteristic while maintaining their mechanical integrity. A 0.010" gap may be present in the mitered joint and is considered normal. For this reason, painted finishes are not recommended for solid wood mitered doors.
